Practice

1.

1/1 point (graded)

Imagine a mountain landscape where the height at a point  $(x, y)$  is  $h(x, y) = x^2 + x + y^4$ . There are two trails in this landscape starting at  $(1, 1)$ . One trail goes in a straight line to  $(1, 2)$  and one trail goes in a straight line to  $(2, 2)$ . Near  $(1, 1)$ , which trail is steeper?

☐ The trail from  $(1, 1)$  to  $(1, 2)$  is steeper.

☒ The trail from  $(1, 1)$  to  $(2, 2)$  is steeper.

Solution:

The first trail points in the direction  $\langle 0, 1 \rangle$  and the second points in the direction  $\langle 1, 1 \rangle$ . Computing the directional derivative at  $(1, 1)$  in each of these directions, we find:

$$\begin{aligned}\nabla h(x, y) &= \langle 2x + 1, 4y^3 \rangle \\ \nabla h(1, 1) &= \langle 3, 4 \rangle \\ D_{\langle 0, 1 \rangle} h(1, 1) &= \nabla h(1, 1) \cdot \langle 0, 1 \rangle = 4 \\ D_{\langle 1, 1 \rangle} h(1, 1) &= \nabla h(1, 1) \cdot \left\langle \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}} \right\rangle = \frac{7}{\sqrt{2}}\end{aligned}$$

Since  $7/\sqrt{2} > 4$ , we conclude that the slope is steeper in the direction  $\langle 1, 1 \rangle$ .

3.

3.0/3 points (graded)

As above let  $h(x, y) = x^2 + x + y^4$ .

Let  $c$  be the curve defined by  $h(x, y) = 3$ . (Notice that  $(1, 1)$  is on the curve  $c$ .)

a.) Find a unit vector which is normal to  $c$  at  $(1, 1)$ .

Answer: [0.6,0.8]

b.) Find a unit vector  $\hat{u}$  which is tangent to  $c$  at  $(1, 1)$ .

Answer: [0.8,-0.6]

c.) Compute  $D_{\hat{u}}h(1,1)$  (where  $\hat{u}$  is the vector you found in part (b).)

0

✓ Answer: 0

d.) (Self reflection.) Can you explain why you got the answer that you did?

Solution:

- a) We learned that the gradient  $\nabla h(1,1)$  points perpendicular to the level curve of  $h(x,y)$  that passes through  $(1,1)$ . Since the question asked for a unit vector, we rescale  $\nabla h(1,1) = \langle 3,4 \rangle$  to have unit length, giving the answer  $\langle 3/5, 4/5 \rangle$ .
- b) Since we already have a unit vector that is normal to the curve, rotating this vector by 90 degrees (clockwise or counter-clockwise) gives a vector that is tangent to the curve. Rotating a vector  $\langle a,b \rangle$  90 degrees clockwise gives the vector  $\langle b,-a \rangle$ . Therefore, the answer is  $\langle 4/5,-3/5 \rangle$ , or its negative.
- c)  $D_{\langle 4/5,-3/5 \rangle}h(1,1) = \langle 3,4 \rangle \cdot \langle 4/5,-3/5 \rangle = 0$ .
- d) Since the vector we found in part (b) is perpendicular to the gradient, the dot product between the two will be zero.
