Question 1

1.0/1.0 point (graded)

From the example, the estimated effect of going to secondary school on cognitive scores is equal to:

- ☐ a. The effect of the scholarship on going to secondary school divided by the effect of the scholarship on cognitive scores
- ☐ b. The effect of the scholarship on going to secondary school multiplied by the effect of the scholarship on cognitive scores
- ☒ c. The effect of the scholarship on cognitive scores divided by the effect of the scholarship on going to secondary school. ✓

Explanation

Functions of Random Variable

- ▶ Module 6: Special Distributions, the Sample Mean, the Central Limit Theorem, and Estimation
- ▶ Module 7: Assessing and Deriving Estimators - Confidence Intervals, and Hypothesis Testing
- ▶ Module 8: Causality, Analyzing Randomized Experiments, & Nonparametric Regression

Your estimated effect is given by $\hat{\beta} = \frac{E[Y_i | Z_i=1] - E[Y_i | Z_i=0]}{E[A_i | z_i=1] - E[A_i | z_i=0]}$ where Y_i denotes cognitive scores, Z_i is a dummy variable equal to 1 if assigned to the treatment group and 0 otherwise, and A_i denotes whether individual i goes to secondary school.

Question 2

1.0/1.0 point (graded)

For men, the scholarship increases the chances of completing secondary school by **38.3%** and increases cognitive scores by **.158** standard deviations, so the estimated effect of secondary school on cognitive scores is:

- ☐ a. **38.3/.158** standard deviations increase in cognitive scores
- ☐ b. **.383/.158** standard deviations increase in cognitive scores
- ☒ c. **.158/.383** standard deviations increase in cognitive scores ✓
- ☐ d. **.158/38.3** standard deviations increase in cognitive scores

Experimental Design

[Finger Exercises due Dec 14, 2016 05:00 IST](#)

Module 12: Homework

This is the correct answer, because the estimated effect of secondary school on cognitive scores will be equal to the effect of the scholarship on cognitive scores divided by the effect of the scholarship on going to secondary school ($\hat{\beta} = \frac{E[Y_i|Z_i=1]-E[Y_i|Z_i=0]}{E[A_i|Z_i=1]-E[A_i|Z_i=0]}$)

Question 3

0.0/1.0 point (graded)

Your IV estimate for the effect of education on cognitive scores is going to be _____ the effect of scholarships on cognitive scores.

- ☐ a. Smaller than, or equal to
- ☐ b. Smaller than
- ☒ c. Larger than
- ☐ d. Larger than, or equal to

Explanation

Homework due Dec 12, 201605:00 IST

► Exit Survey

If everyone who got the scholarship went to secondary school, the denominator in the formula above would be equal to 1, and therefore, β would just be the same as the effect of the scholarship. But if not everybody goes to school, you are dividing the numerator by a number smaller than one, so you will get a larger number: intuitively, it “scales up” the reduced form coefficient to take into account that the difference is accounted for only a fraction of the people who actually went to school.
