# 11.2.2 An Application: Rank-1 Approximation

## Video

Start of transcript. Skip to the end.

Dr. Robert van de Geijn: So let's look at Rank-1 Approximation.

Here's a picture.

Think of this picture as a matrix.

Think of this red line as representing the  $j$ th column so that the matrix can be thought of as consisting of  $n$  columns.

Homework 11.2.2.1: How is  $s_j$  in  $\mathbf{T}$ ?

4

?

rank-1 approximation

In practice, I guess rank-1 (and rank 2) are of any use only in pictures where columns share a lot of similarity? Or are there any theoretical pur

Calculator

Homework 11.2.2.1

1/1 point (graded)  
Let  $\mathbf{S}$  and  $\mathbf{T}$  be subspaces of  $\mathbb{R}^m$  and  $\mathbf{S} \subset \mathbf{T}$ .

$\dim(\mathbf{S}) \leq \dim(\mathbf{T})$ .

Always

✔ Answer: Always

Proof by contradiction:

Let  $\dim(\mathbf{S}) = k$  and  $\dim(\mathbf{T}) = n$ , where  $k > n$ . Then we can find a set of  $k$  vectors  $\{s_0, \dots, s_{k-1}\}$  that form a basis for  $\mathbf{S}$  and a set of  $n$  vectors  $\{t_0, \dots, t_{n-1}\}$  that form a basis for  $\mathbf{T}$ .

Let

$$S = \left( \begin{array}{c|c|c|c} s_0 & s_1 & \cdots & s_{k-1} \end{array} \right) \quad \text{and} \quad T = \left( \begin{array}{c|c|c|c} t_0 & t_1 & \cdots & t_{n-1} \end{array} \right).$$

$s_j \in \mathbf{T}$  and hence can be written as  $s_j = T x_j$ . Thus

$$S = T \underbrace{\left( \begin{array}{c|c|c|c} x_0 & x_1 & \cdots & x_{k-1} \end{array} \right)}_X = TX$$

But  $X$  is  $n \times k$  which has more columns than it has rows. Hence, there must exist vector  $z \neq 0$  such that  $Xz = 0$ .

But then

$$Sz = TXz = T0 = 0$$

and hence  $S$  does not have linearly independent columns. But, we assumed that the columns of  $S$  formed a basis, and hence this is a contradiction. We conclude that  $\dim(\mathbf{S}) \leq \dim(\mathbf{T})$ .

Homework 11.2.2.2

10.0/10.0 points (graded)  
Let  $u \in \mathbb{R}^m$  and  $v \in \mathbb{R}^n$ . Then the  $m \times n$  matrix  $uv^T$  has a rank of at most one.

TRUE

✔ Answer: TRUE

Let  $y \in \mathcal{C}(uv^T)$ . We will show that then  $y \in \text{Span}(\{u\})$  and hence  $\mathcal{C}(uv^T) \subset \text{Span}(\{u\})$ .

$$\begin{aligned} y &\in \mathcal{C}(uv^T) \\ \Rightarrow &\text{ < there exists a } x \in \mathbb{R}^n \text{ such that } y = uv^T x > \\ y &= uv^T x \\ \Rightarrow &\text{ < } u\alpha = \alpha u \text{ when } \alpha \in \mathbb{R} > \\ y &= (v^T x) u \\ \Rightarrow &\text{ < Definition of span and } v^T x \text{ is a scalar >} \end{aligned}$$

🧮 Calculator

$y \in \text{Span}(\{u\})$

Hence  $\dim(\mathcal{C}(uv^T)) \leq \dim(\text{Span}(\{u\})) \leq 1$ . Since  $\text{rank}(uv^T) = \dim(\mathcal{C}(uv^T))$  we conclude that  $\text{rank}(uv^T) \leq 1$ .

Homework 11.2.2.3

1/1 point (graded)  
Let  $u \in \mathbb{R}^m$  and  $v \in \mathbb{R}^n$ . Then  $uv^T$  has rank equal to zero if  
(Mark all correct answers.)

- ☒  $u = 0$  (the zero vector in  $\mathbb{R}^m$ ).
- ☒  $v = 0$  (the zero vector in  $\mathbb{R}^n$ ).
- ☐ Never.
- ☐ Always.

$u = 0$  (the zero vector in  $\mathbb{R}^m$ ).

$v = 0$  (the zero vector in  $\mathbb{R}^n$ ).
