**Apply**

NASA's Jet Propulsion Laboratory (JPL) hosts a webpage called State Of The Oceans (SOTO) that allows you to interact with maps that help us visualize ocean data. The image below shows the sea surface temperature (in degrees Celsius) on April 7, 2020. The colors correspond to level curves on the map.

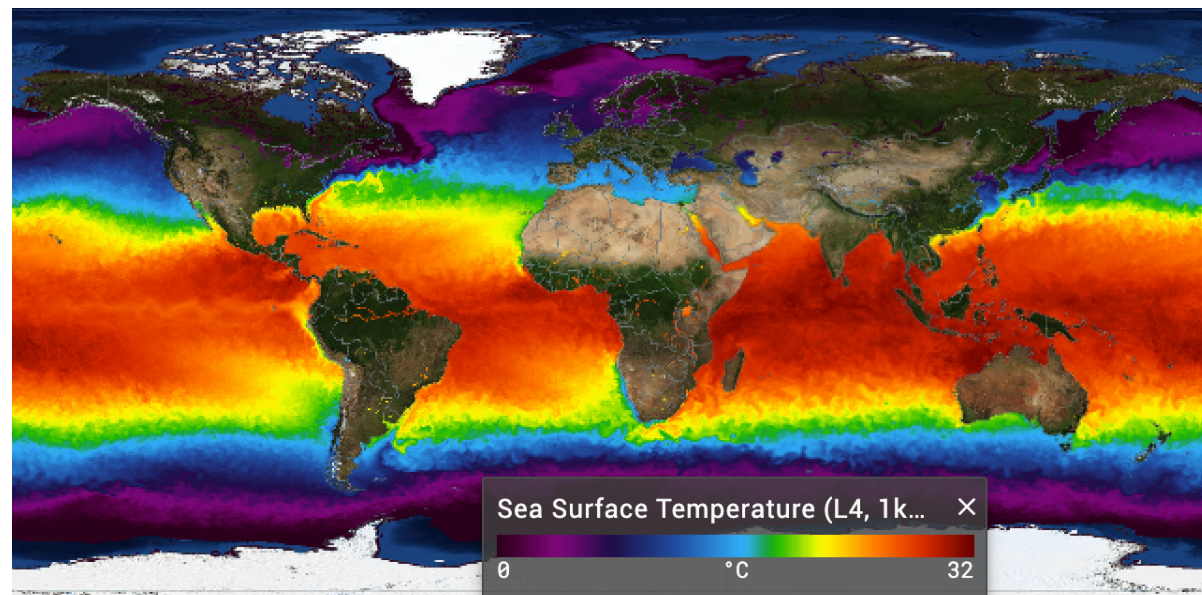

Image accessed April 7, 2020 from (<https://podaac.jpl.nasa.gov/>)

Suppose we zoomed in to a very small region on the map, converted the coloring to level curves for visual clarity, and obtained the figure shown below.

Say that the level curves above are the level curves of a temperature function $T(x, y)$, where $T(x, y)$ denotes the temperature of the ocean at longitude x and latitude y . (We will assume that the x and y -axes have been rescaled to correspond to the values shown.)

The partial derivative with respect to x tells us how the temperature changes if we move in the x -direction. Similarly, the partial derivative with respect to y tells us how the temperature changes if we move in the y -direction. In this example, these derivatives tell us how the temperature of the ocean changes if we move east or north.

Positive, negative, or zero

6/6 points (graded)

Calculator

Hide Notes

From looking at the level curves, determine whether each of the following values are positive, negative, or zero. Use that information to interpret how temperature is changing.

Positive

▼

✓

At $(1, 1)$, the temperature is

increasing

▼

✓

to the east

$T_x(1, 1)$:

Answer: Positive

increasing

Zero

▼

✓

At $(0, -1)$, the temperature is

constant

▼

✓

to the north

$T_y(0, -1)$:

Answer: Zero

constant

Negative

▼

✓

At $(-1, -1)$, the temperature is

decreasing

▼

✓

to the north

$T_y(-1, -1)$:

Answer: Negative

decreasing

Answers are displayed within the problem

Compare partial derivatives 1

1/1 point (graded)

By looking at the level curves, decide which is greater: the temperature change to the north at the point $(1, 0)$ given by $T_y(1, 0)$, or the temperature change to the north at the point $(2, 0)$ given by $T_y(2, 0)$.

	Greetings. Could someone please explain why $T_y(-1,-1)$ for the 'Positive, negative, or zero' question's value is negative?	
?	Query in 'positive, negative or zero' Can someone explain the logic- At (1,1), the temperature is increasing towards east? Also, why the partial derivative is positive?	2
💬	I think there is a small typo First thanks a lot to the staff for the mooc. For the first exercise positive, negative of constant the temperature is (positive, negative ...	8
