

# Fermat's Little Theorem (1)

- Fermat discovered many beautiful results on prime numbers.
- **Fermat's Little Thm** is one of them.
- It is simple, but very useful.  
It has applications to Number Theory and Cryptography.

Pierre de  
Fermat  
(1607?-1665)

# Fermat's Little Theorem (2)

## Fermat's Little Theorem

For any **prime number**  $P$  and any

$$1 \leq A \leq P-1,$$

$$A^{P-1} \equiv 1 \pmod{P}.$$

## Examples:

➤  $(P = 5, A = 2)$

$$2^4 \equiv 16 \equiv 1 \pmod{5}.$$

➤  $(P = 11, A = 3)$

$$3^{10} \equiv 59049 \equiv 1 \pmod{11}.$$

Pierre de  
Fermat  
(1607?-1665)

# Fermat's Little Theorem (3)

## Proof of Fermat's Little Thm:

$A \times B \pmod{P}$  for  $B = 1, 2, \dots, P-1$   
are **not congruent**  $\pmod{P}$  to each other. Hence

$$\begin{aligned} A \times (A \times 2) \times \dots \times (A \times (P-1)) \\ \equiv 1 \times 2 \times \dots \times (P-1) \end{aligned}$$

$$\Rightarrow A^{P-1} \times (P-1)! \equiv (P-1)!$$

$$((P-1)! = 1 \times 2 \times \dots \times (P-1))$$

$$\Rightarrow (A^{P-1} - 1) \times (P-1)! \equiv 0$$

$$\Rightarrow A^{P-1} \equiv 1.$$

# Fermat's Little Theorem (4)

- In the proof of Fermat's Little Thm,  
 $(P-1)! = 1 \times 2 \times \cdots \times (P-1)$   
plays an important role.
- We can calculate it (mod P)  
by **Wilson's Thm**.
- We shall prove Wilson's Thm using  
**Lagrange's Thm** on roots of  
polynomials (mod P).

Joseph-Louis  
Lagrange  
(1736-1813)

# Fermat's Little Theorem (5)

**Wilson's Theorem:** for a **prime number**  $P$ ,  
$$(P-1)! \equiv -1 \pmod{P}$$

## Examples:

- $(P=2) \quad 1! \equiv 1 \equiv -1 \pmod{2}$
- $(P=3) \quad 2! \equiv 1 \times 2 \equiv 2 \equiv -1 \pmod{3}$
- $(P=7) \quad 6! \equiv 1 \times 2 \times 3 \times 4 \times 5 \times 6$   
 $\equiv 720 \equiv -1 \pmod{7}$

# Fermat's Little Theorem (6)

## Lagrange's Theorem

$$F(X) = X^D + C_1X^{D-1} + \cdots + C_{D-1}X + C_D$$

➤ If  $F(A) \equiv 0 \pmod{P}$ ,

$$F(X) \equiv (X-A)G(X)$$

for some  $G(X)$ .

➤ If  $0 \leq A_1 < \cdots < A_K \leq P-1$  and

$$F(A_j) \equiv 0 \pmod{P},$$

$$F(X) \equiv (X-A_1)\cdots(X-A_K)H(X)$$

for some  $H(X)$ . ( $\Rightarrow K \leq D$ )

Joseph-Louis  
Lagrange  
(1736-1813)

# Fermat's Little Theorem (7)

## Proof of Lagrange's Thm:

$$F(X) = X^D + C_1X^{D-1} + \cdots + C_{D-1}X + C_D$$

$$F(A) = A^D + C_1A^{D-1} + \cdots + C_{D-1}A + C_D$$

$$\begin{aligned} F(X) - F(A) &= (X^D - A^D) + C_1(X^{D-1} - A^{D-1}) \\ &\quad + \cdots + C_{D-1}(X - A) \\ &= (X - A)G(X) \quad \text{for some } G(X). \end{aligned}$$

Since  $F(A) \equiv 0$ ,

$$F(X) \equiv (X - A)G(X).$$

The second assertion is proved by **induction on K**.

# Fermat's Little Theorem (8)

**Proof of Wilson's Theorem:**

By **Fermat's Little Thm**,

$$A^{P-1} \equiv 1 \quad \text{for } A = 1, 2, \dots, P-1.$$

By **Lagrange's Thm**,

$$X^{P-1} - 1 \equiv (X-1)(X-2) \cdots (X-(P-1)).$$

Comparing constant terms,

$$-1 \equiv (-1)^{P-1} \times (P-1)! \equiv (P-1)!$$

# Fermat's Little Theorem (9)

## ➤ An application of Lagrange's Thm

### Theorem

There are **at most D** elements  $1 \leq A \leq P-1$  satisfying  $A^D - 1 \equiv 0 \pmod{P}$ .

$$F(X) = X^D - 1$$

If  $1 \leq A \leq P-1$  satisfies  $A^D - 1 \equiv 0$ ,

$$F(A) \equiv 0 \pmod{P}.$$

By **Lagrange's Thm**, # of such A is  $\leq D$ .
