G1 (1/1 point)

The figure below shows a partial 4X4 matrix, is there some way of filling up the rest of the omitted entries to produce a magic square of size 4?

☐ yes

☒ no

$$\begin{bmatrix} 2 & 3 & \square & \square \\ 4 & \square & \square & \square \\ \square & \square & \square & \square \\ \square & \square & \square & \square \end{bmatrix}$$

EXPLANATION

If there is some way of producing a magic square of size 4:

$$\begin{bmatrix} 2 & 3 & a & b \\ 4 & c & d & e \\ f & g & h & \square \\ i & j & \square & k \end{bmatrix}$$

then $1 \leq a, b, c, d, e, f, g, h, i, j, k \leq 16$ and $a, b, c, d, e, f, g, h, i, j, k$ do not equal to each other

the magic sum of size 4 is: $\frac{n*(n^2+1)}{2} = 34$,

Taking the sum of the first row and first column respectively:

$$\begin{cases} 2 + 3 + a + b = 34 \\ 2 + 4 + f + i = 34 \end{cases}$$

so that

1) if a, b are equal to 13, 16, respectively, then we cannot find f, i such that the sum of the two is equal to 28 (14+14, 15+13 and 12+16 are all impossible)

2) If a and b are equal to 14 and 15, and f and i are equal to 12 and 16, taking the sum of the second row, second column and the anti-diagonal respectively:

$$\begin{cases} 4 + c + d + e = 34 \\ 3 + c + g + j = 34 \\ 2 + c + h + k = 34 \end{cases}$$

for which $c, d, e, g, j, h, k \in \{1, 5, 6, 7, 8, 9, 10, 11, 13\}$, taking the sum of the equations $9 + 3c + d + e + g + h + j + k = 102$, so if $c = 13$, $d + e + g + h + j + k = 54$, but $11 + 10 + 9 + 8 + 7 + 6 < 54$, contradiction. The same is true for c smaller than 13.

Combining our results from 1) and 2), we see that our assumptions cannot hold, so it is impossible to construct a magic square of size four with the given conditions.

G2 (1/1 point)

Which number below, if used as the magic sum, allows us to construct magic squares of size 3, using only non-repeated natural numbers?

☐ 12

☐ 23

☒ 18 
☐ 34

☐ 20

EXPLANATION

Let's first create a magic square of size 3

| | | |
|----|----|----|
| M1 | M2 | M3 |
| M4 | M5 | M6 |
| M7 | M8 | M9 |

we assume the value of to add elements in each row/column/diagonal is k , we have:

$$\begin{cases} M_1 + M_5 + M_9 = k \\ M_2 + M_5 + M_8 = k \\ M_3 + M_5 + M_7 = k \end{cases}$$

then we add the three equation together

$$M_1 + M_2 + M_3 + 3M_5 + M_7 + M_8 + M_9 = 3k \quad (1)$$

besides,

$$\begin{cases} M_1 + M_2 + M_3 = k \\ M_7 + M_8 + M_9 = k \end{cases}$$

put these two equation into (1), we have $M_5 = \frac{k}{3}$

as a result, k must be natural numbers for k to be multiples of 3.

the least k of magic square is 15, so only 18 is possible
