Question 1

1 point possible (graded)

Suppose you have the CDF for some random variable, X that follows a binomial distribution with $p = 0.2$. Suppose further that you want to find the density of $Y = X^2$, and that the CDF of Y , $F_Y(y)$ is known.

True or False: The density of Y can be found by differentiating the CDF.

☒ True ❌

☐ False ✅

Explanation

Since X follows a binomial distribution, it is a discrete random variable, so standard functions of it will also be discrete. Therefore, even if we know that CDF of Y , we can not differentiate to obtain its distribution, or PF. The method Professor Ellison outlined in class only applies to continuous random variables.
