

QUESTION 2 (1/1 point)

You are preparing a dataset that contains some missing values.

Why should missing values be treated before training a machine learning model?

- ☐ Missing values add numerous new categories to categorical variable, biasing the training of machine learning models.
- ☐ Missing values convey information which biases the result of training a machine learning model.
- ☒ Many machine learning models are not able to handle missing values in their calculations. ✓
- ☐ Many machine learning models calculate multiple solutions if missing values are present.

EXPLANATION

Missing values can cause errors in some machine learning model calculations.
