

## PROBLEM 3-1 (1 point possible)

Play around with your code on the cityTemps.txt data. Try clustering into a different number of clusters, using different linkage criteria, and with or without scaling the data. Answer the following questions:

When clustering without scaling and with the total number of clusters 10, which cities are always clustered by themselves?

- ☒ Honolulu and Fairbanks ✓
- ☐ Anchorage and Olympia
- ☐ LasVegas and SanFrancisco
- ☐ Duluth and Miami

[Hide Answer](#)*You have used 0 of 2 submissions*

## PROBLEM 3-2 (1 point possible)

When clustering the data into 5 clusters using single linkage criteria, which city is in a cluster by itself when using scaling but is not in a cluster by itself when not using scaling?

- ☐ LosAngeles
- ☐ Anchorage
- ☒ SanFrancisco ✓
- ☐ SanDiego

[Hide Answer](#)*You have used 0 of 2 submissions*

## PROBLEM 3-3 (1 point possible)

In this example, scaling reduces the relative importance of days of precipitation.

- ☒ True ✓
- ☐ False

**EXPLANATION**

Scaling effectively normalizes each feature to have a mean of 0 and standard deviation of 1. This way, discrepancies between features are not as large and we do not have certain features overwhelming other features.
