11.2.5 An Application: Rank-k Approximation

Video

[Start of transcript. Skip to the end.](#)

Dr. Robert van de Geijn: The way we discussed the theory behind the rank two approximation was completely general. We didn't really put a restriction on the number of columns in our matrix A. What that means is that we can now look at what happens as we choose more and more columns for our matrix A.

Homework 11.2.5.2 Cholesky

Using the Cholesky algorithm in the function is producing an image of a black box for me. Do you know what the problem may be? Using the LU...

PROFESSOR: So the answer is that it's true.

Well, it'd better be true because otherwise

why have we been calling this a rank k approximation?

And this is the key insight.

If you have two subspaces of \mathbb{R}^n , and S is a subspace of T ,

Homework 11.2.5.1

1/1 point (graded)

Let $\mathbf{U} \in \mathbb{R}^{m \times k}$ and $\mathbf{V} \in \mathbb{R}^{n \times k}$. Then the $m \times n$ matrix \mathbf{UV}^T has a rank of at most k .

TRUE

✓ Answer: TRUE

Answer: True

Again, we build on the insight that if $S, T \subset \mathbb{R}^m$ are subspaces and $S \subset T$, then $\dim(S) \leq \dim(T)$. Here $T = \mathcal{C}(\{U\})$ and $S = \mathcal{C}(UV^T)$.

Now, clearly $\text{rank}(U) = \dim(C(U)) \leq k$ since U is a $m \times k$ matrix. Let $y \in C(UV^T)$. We will show that then $y \in C(U)$.

$$y \in \mathcal{C}(UV^T)$$

$$\Rightarrow \text{ < there exists a } x \in \mathbb{R}^n \text{ such that } y = UV^T x \text{ >}$$

$$y = UV^T x$$

$$\Rightarrow \langle z = V^T x \rangle$$

$$y = Uz$$

⇒ **< Definition of column space >**

$$y \in \mathcal{C}(U).$$

Hence $\text{rank}(UV^T) = \dim(\mathcal{C}(UV^T)) \leq \dim(\mathcal{C}(U)) = \text{rank}(U) \leq k$.

Homework 11.2.5.2

1 point possible (graded)

We discussed in this section that the projection of \mathbf{B} onto the column space of \mathbf{A} is given by $\mathbf{A}(\mathbf{A}^T \mathbf{A})^{-1} \mathbf{A}^T \mathbf{B}$.

 Calculator

compute $V = (A^T A)^{-1} A^T B$, then AV is an approximation to B that requires only $m \times k$ matrix A and $k \times n$ matrix V .

To compute V , we can perform the following steps:

- Form $C = A^T A$.
- Compute the LU factorization of C , overwriting C with the resulting L and U .
- Compute $V = A^T B$.
- Solve $LX = V$, overwriting V with the solution matrix X .
- Solve $UX = V$, overwriting V with the solution matrix X .
- Compute the approximation of B as $A \cdot V$ (A times V). In practice, you would not compute this approximation, but store A and V instead, which typically means less data is stored.
