

Visualizing additional dimensions?

m_powers 1d

This video shows an example of visualizing an objective f based on two independent variables (x, y) .

A simplified version of another project I am working on (more on this in another post) involves maximizing an objective z based on *three* variables (w, x, y) . I suspect there are a number of local maxima and I'm interested in visualizing these in some way analogous to the contour plots in this section. Any suggestions? I've looked through some of [this article](#) but all the examples involve two input variables.

Thanks for this! This helps me visualize a possible approach: 3D scatter plot, but only display values with z above some threshold. Should be able to see hotspots pretty well in that case.

In the example you suggested, it would be nice to be able to slide those cross-section planes around to quickly find coordinates of intersections.

wangaj_mit Staff 1d

I don't have a direct solution, but this came to mind. While you can't see all planes at once, this shows contour/density plots along the three principle orthogonal planes.

<https://en.wikipedia.org/wiki/File:Microwaveoventransient.webm>

You could also look up how they present CT scans in medicine, where they image a bunch of slices along an axis. If you step through / animate those slices for your function, you could get a sense of where your maxima lie.

Could think of the following visualizations, might be helpful.

3D scatterplot with color representing the 4th variable

```
from matplotlib import pyplot as plt
import numpy as np
fig = plt.figure()
ax = fig.add_subplot(111, projection='3d')
w = np.linspace(-1,1,20)
x = np.linspace(-1,1,20)
y = np.linspace(-1,1,20)
W, X, Y = np.meshgrid(w, x, y)
Z = np.sin(W**2 + X**2) + np.sin(X**2 + Y**2)
ax.scatter3D(W, X, Y, c=Z, cmap='jet', alpha=1)
plt.show()
```
