## 4.1.2 Problem Set: Instructions

[Bookmark this page](#)

In this pset, you will implement an initial value problem (IVP) class and methods and then apply them to model the trajectory of a hail particle and a Martian lander (yes, quite a range!). Along the way, you'll also get some more experience with plotting in Python.

- Please take a moment to familiarize yourself with the CSE.0002x style guide available in Section [2.1.6](#).
- You can download the provided files and then upload your solution files on the Vocareum website using the link provided in Section [4.1.3](#).
- You should write code only in the sections marked as follows:

```
##### BEGIN SOLUTION #####
raise NotImplementedError("...")

##### END SOLUTION #####
```

Remember to remove or comment out the raised `NotImplementedError`. Do not write or modify code outside those markers. However, you may experiment with code in the "`__main__`" blocks, as they will be ignored for grading.

- **WARNING:** You may not use NumPy anywhere in your implementation for solving this pset! The autograder will assign a 0 if it detects any usage of NumPy.
