1. The goal

 Bookmark this page

Our goal in this first part of the project is to extend the models of two interacting species to model three (or more) species interacting in an environment.

In this first section, we will review what we've learned about modeling one population (the logistic model) and two interacting populations (the Lotka–Volterra equations). The logistic equation was introduced in the course *Introduction to differential equations*, and the predator-prey model was introduced in the course *Differential equations: 2x2 systems*. In this first review section, we will provide complete solutions once you have run out of attempts. In the following two parts of the project, you are being tested and you will not be able to see solutions. You will however receive feedback as to whether or not your submission was correct.

We encourage collaboration and discussion on all of the items in the final project, but do not give away direct answers, and only discuss methods and approach.
