1. Understanding 3 competing species in an environment

 Bookmark this page

Objectives

- Extend the Lotka–Volterra population model of 2 interacting species to a model for 3 (or more) interacting species.
- Generalize linearization techniques and the Jacobian matrix to higher order systems.
- Use MATLAB and linearization to gain information about higher order nonlinear systems.

Note that starting now, you are being tested. You will not be able to view solutions. You will receive feedback on whether or not your solution was correct. However, collaboration and discussion (without revealing answers) is encouraged.
