1/4

Take a moment to familiarize yourself with the main problem types we use in this course.

Checking and submitting an answer

0 points possible (ungraded)
The edX platform is able to check your answers and give you immediate feedback. When you "check" a problem, it is automatically submitted for grading purposes.

Depending on the type of the problem you may have access to the "show answer" button. In the lecture exercises as well as the part A and part B Homework assignments, this option to show the answer will appear only after the due date has passed, you have run out of problem attempts, or you have already submitted the correct answer. You will never get detailed solutions to the final exam.

This problem has unlimited attempts. If you get an answer wrong, you can simply try again until you get it right. How many weeks will this course be?

Submit

Resetting a Problem

0.0/1.0 point (ungraded)
Some problems involve randomized parameters, or other elements that you may wish to reset to the original configuration. Here is an example where the variables x_1 and x_2 are randomized. After one attempt, you can click reset to see the values change!

Let $x_1 = 12$ and $x_2 = 75$.

Enter the numeric value of $x_1 + x_2$ in the answer box below.

Submit

Limited Number of Attempts 1

0 points possible (ungraded)
Most of the time, you will have a limited number of times that you can attempt a problem. To save an answer and keep it there until you come back, use the save button.

How much does it cost to take an edX course?

(Enter a number.)

Submit

You have used 0 of 100 attempts

Limited Number of Attempts 2

0 points possible (ungraded)
Multiple choice problems will almost always have between 1 and 3 attempts.

Which choice is correct?

☐ incorrect

☐ correct

☐ incorrect

☐ incorrect

Submit

You have used 0 of 3 attempts

Formula Entry Problems

0 points possible (ungraded)
This is a math class, which means we are going to be using formulas. And sometimes, we want you to find these formulas. There are some rules for entering formulas into the text entry box (which follows rules for ASCII math).

- Use $+$ to denote addition; e.g. 2+3.
- Use $-$ to denote subtraction; e.g. x-1.
- Use $*$ to denote multiplication; e.g. 2*x.
- Use $\wedge$ to denote exponentiation; e.g. x $\wedge$ 2 for x^2 .
- Use $/$ to denote division; e.g. 7/x for $\frac{7}{x}$.
- Type **pi** for the mathematical constant π .
- Type **e** for the mathematical constant e .
- Type **sqrt(x)**, **sin(x)**, **cos(x)**, **ln(x)**, **arccos(x)**, etc. for the known functions $\sqrt{x}$, **sin x**, **cos x**, **ln x**, **arccos x** etc. Note that parentheses are required.
- Use parentheses () to specify order of operations.

Each formula entry box will have a Formula Input Help button below the answer button, where you can find these facts about how to enter formulas. (See the button below.)

Example

To see how the answer box works, enter the function $2e^{x-1} + \sqrt{y}$ using the rules above. (Type 2*e^(x-1)+sqrt(y) into the answer box.)

Below the answer box, there is a display box that shows how the system interpreted your formula. (You will get an error if you try to enter variables, like z , that are unspecified in the problem. You will get an error as you are typing if you

have only one half "(" of a parenthesis. Just continue typing, and when you enter the closing parenthesis ")", the error will go away.)

MATLAB problems

In addition to the standard edX problem types you've seen here, we will also be using MATLAB in many of the problems in this course. By hitting next at the bottom of the page, you will automatically be directed to an introduction to MATLAB Online, and example problems of using MATLAB within the edX platform.
