

[Course](#) > [6. ROIs & Results](#) > [6.1. Introduction](#) > 6.1.1. Description & Outline

6.1.1. Description & Outline

1. Digital Images
2. Of Colors & Dimensions
3. Resizing, Interpolation & Mathematical Operations
4. Filtering

5. Segmentation, from Intensities to Objects

6. Regions of Interest & Results

7. Color in Depth, Projections & Reslicing

Extra. ImageJ Macro Language Programming Primer

Week Overview

- Section 1: Introduction
- Section 2: Regions of Interest (ROIs)
- Section 3: Results Tables
- Section 4: Batch Processing
- Section 5: Conclusion

Description

With this week, we now have all the fundamental tools behind us and it is time to see how we can start manipulating all the data we have gathered. We will cover the concepts of Regions of Interest (ROIs) and how these can be used to perform measurements or operations on selected parts of an image. This will elad to a discussion on measurement bias and how we can avoid it. We will perform measurements and manipulate the data through Results Tables. Finally now that all the tools are available individually, we will discuss the criteria that are necessary to perform batch processing on many images and how to batch process data in Fiji.

By the end of this week, you will be able to enumerate the different types of ROIs available in Fiji and recall ways on how these can be manipulated using the macro language or the Fiji user interface. You will be able to describe the principle of unbiased measurements and to evaluate its impact on your analyses. You will be capable of composing a simple code that can read results tables and write new columns created by yourself. Finally, you will be know to use batch processing within Fiji in order to process all the images of an experiment.
