

Modeling: assignment problem

Michel Bierlaire

Practice quiz

François, 24, and Aria, 26, are traveling from Lausanne to Paris. There are only two seats available in the TGV: one first class ticket at €92 and one second class ticket at €68, discounted to €49 if the traveler is 25 or younger. In order to minimize the total costs, it makes sense for François to take the second class ticket and for Aria the first class ticket.

Model the problem as a transshipment problem, and draw the corresponding network. Find the solution using the simplex algorithm.
