Description length

 Bookmark this page

The **information** contained in an object is estimated by the length of its binary representation. Intuitively, if an object contains a lot of information, then it cannot be described in a concise manner and should be considered **complex**. This definition applies to any object or situation, as long as this object or situation can be coded to be represented in a computer.

In this chapter, we will talk a lot about **coding**, as it is the most basic way to measure information content.
