Plain complexity vs. Prefix complexity

 Bookmark this page

Problem: How do plain complexity and prefix complexity compare?

Thanks to prefix codes, we can establish the following relation between plain complexity C and prefix complexity K
($O(1)$ designates some constant):
$$C(s) + O(1) \leq K(s) < C(s) + 2 \times \log(C(s)) + O(1)$$

► proof of the inequalities

[Don't forget to watch the debate "prefix complexity vs. plain complexity" at the end of this chapter.]
