What you will learn in this chapter

 Bookmark this page

What you will learn in this chapter:

- that **unexpected** means *abnormally simple*,
- why **coincidences** are so unexpected,
- how to define **subjective information** and **interest**,
- when an event or an action is **relevant**,
- what is common to **aesthetics**, **emotion**, **humour** and **coding**.

Detailed outline Chapter (5)

Subjective Information and Simplicity

Intuitive approach to subjective probability

First contact with subjective information with an example: a consecutive lottery draw.

Why *subjective probability* sometimes seems in total contradiction with standard algorithmic probability.

Cognitive complexity

Our brain seems to be sensitive to Kolmogorov complexity!

For instance, newsworthiness depends on the *simplicity of locations*.

Aesthetics, when it includes a component of surprise, depends on simplicity as well.

Relevance

The notion of *unexpectedness* is shown to be central to model *relevance*, which is an ultimate goal of AI ! Unexpectedness is defined as *complexity drop*.

Coincidences will be modelled as a case study.

A compressionist view of AI

Many aspect of intelligent processing will be revisited from the compressionist perspective.

AI systems will not be regarded as intelligent as long as they remain unable to understand human intelligence and to adapt to it. Algorithmic Information offers us a way to model key components of human intellect, such as **surprise**, **relevance**, **aesthetics** or **emotional intensity**. Why does AIT have something to say on these matters? Could it be because our mind does process algorithmic information?
